Re: U.S. Utility Patent Application No. 09/986,319
Filed: November 8, 2001
Inventor: Timothy J. SIMMS
For: System and Method For Establishing Secure Communication Using A Shared Secret Key
Dkt. No.: 16222.004

Sir:

Transmitted herewith for appropriate action by the U.S. Patent and Trademark Office are the following documents:

1. This Transmittal Letter;
2. An Information Disclosure Statement;
3. Form PTO-1449 (with 63 attached references); and
4. a Return postcard.

It is respectfully requested that the attached postcard be stamped with the date of filing of these documents, and that it be returned to our courier.

Sincerely,

Jay Chawla

Jay P. Chawla (Reg. No. 44,073)
Leslie L. Jacobs, Jr. (Reg. No. 40,659)

In re application of SIMMS, *et al.*

Appln. No. 09/986,319 Group Art Unit: 2131

Filed: November 8, 2001 Examiner: To Be Assigned

For: **SYSTEM AND METHOD FOR ESTABLISHING SECURE COMMUNICATION USING A SHARED SECRET KEY**

Atty. Dkt.: 16222.004

INFORMATION DISCLOSURE STATEMENT

Assistant Commissioner for Patents
and Trademarks
Washington, D.C. 20231

Dear Sir:

Please find enclosed copies of the documents listed on the attached Form PTO – 1449, which are submitted for the Examiner's review.

CONCISE STATEMENT OF RELEVANCE

It is respectfully requested that the information above be expressly considered during the prosecution of this application, and that the references be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

Included among the references in this IDS is a European patent, and its corresponding PCT application, each published in the French language. Applicant provides the following concise statements of relevance for both of these related references.

Patent EP 0 824 732 B1 contains a French specification, and claim sets in English, German, and French. In addition to inviting the Examiner to consider the aforementioned English claims, Applicant provides the English language claim set as a concise statement of the relevance of Patent EP 0 824 732 B1:

> "*1. Tamper protection and activation method for an electronic gaming device including at least one housing (BT), as well as at least one portable article (OB) capable of cooperating with the housing, in which method at least one result-encryption key is stored in the housing and an authenticatable set of digital game data (JE) representative of a game is stored in the portable article, the*

portable article is made to cooperate with the housing, the authentication of the set of game data is verified (8) within the housing and this set of game data is stored in a working memory (MT) of the housing, in such a way as to authorize the running (9) of the game in the housing, then, after the running of at least a part of the game, a result information item (IFR) dependent on the said game is encrypted (10) within the housing with the aid at least of the said result-encryption key, and this encrypted result information item (IFRc) is stored (11) in a result memory (MR) of the portable article, then, the portable article is made to cooperate with a validation station (ST) having access to the said result-encryption key, the said station performing a validation processing (13) on the basis at least of the said encrypted result information item and of the said result-encryption key.

2. *Method according to Claim 1, characterized in that the validation process includes decryption of the encrypted result information items.*

3. *Method according to Claim 1, characterized in that the unencrypted result information item is stored in the portable article, jointly with encrypted result information item, and in that the validation processing includes re-encryption of the unencrypted result information item stored in the portable article and a comparison of this re-encrypted result information item with the encrypted result information item stored in the result memory of the portable article.*

4. *Method according to one of Claims 1 to 3, characterized in that when the authentication of the set of game data of the portable article has been verified and the said set has been stored in the working memory of the housing, all subsequent utilization, by the housing, of the set of game data of this portable article is prohibited (20).*

5. *Method according to Claim 4, characterized in that, the device comprising several housings and several portable articles, when the authentication of the set of game data of one of the portable articles has been verified and when the said set has been stored in the working memory of one of the housings, all subsequent utilization, by any one of the housings, of the set of game data of this portable article is prohibited.*

6. *Method according to one of the preceding claims, characterized in that the set of game data stored in the portable article is authenticated by appending thereto an authentication certificate (CTF) linked in a one-to-one manner with the said set of game*

data (JE) and in that the verification of the authentication of the set of game data includes a recalculation of the authentication certificate within the housing and a comparison between the recalculated authentication certificate and the authentication certificate stored in the portable article.

7. *Method according to Claim 4 or 5 taken in combination with Claim 6, characterized in that all subsequent utilization of a set of game data is prohibited by altering, in the corresponding portable article, at least partially the said authentication certificate and/or at least partially the set of game data.*

8. *Method according to one of the preceding claims taken in combination with Claim 4, characterized in that the storage of the encrypted result information item in the portable article is authorized (21) only if all subsequent utilization of the set of game data of this portable article has been previously prohibited.*

9. *Method according to one of the preceding claims, characterized in that a housing-encryption key (Kf) is stored in the housing.*

10. *Method according to one of the preceding claims, characterized in that at least one game-encryption key (Km) is stored in the housing, in that the authentication of the set of game data stored in the portable article includes at least partial encryption of this set of game data, or of an information item (CTF) linked with this set of game data, with the aid of the game-encryption key (Km), before reading by the housing, and in that the verification of the authentication of this set of game data includes decryption within the housing with the aid of the game-encryption key.*

11. *Method according to Claims 6 and 10, characterized in that only the authentication certificate (CTF) is encrypted and decrypted.*

12. *Method according to Claim 9 taken in combination with Claim 10 or 11, characterized in that the game-encryption key (Km) having been encrypted with the aid of the housing-encryption key (Kf) is stored in the housing.*

13. *Method according to Claim 9 taken in combination with one of Claims 10 to 12, characterized in that, the device including several housings and several portable articles, a different housing-encryption key (Kf) is associated with each housing whilst the game-encryption key (Km) is common for all the housings and to all the portable articles, in that the housing-encryption key of a housing is stored in the latter before storage of the game-encryption key, and in that the set of game data of a portable*

article is stored in the latter, already at least partially encrypted, or associated with an information item (CTFc) already at least partially encrypted, with the aid of the game-encryption key.

14. *Method according to Claim 9 or one of Claims 10 to 13, characterized in that the result-encryption key (Kr) is the housing-encryption key (Kf), or the game-encryption key (Km), or is obtained from a combination of the housing-encryption key and of the game-encryption key.*

15. *Method according to one of the preceding claims, characterized in that a key information item (ICR) associated in a one-to-one manner with the said result-encryption key is stored in the portable article cooperating with the housing, and in that the validation station has access to the said result-encryption key by reading the said key information item stored in the portable article.*

16. *Method according to one of the preceding claims, characterized in that the set of game data (JE) of a portable article is read by way of a serial protocol between the portable article and the housing.*

17. *Electronic gaming device, characterized in that it comprises at least one housing (BT), at least one portable article (OB), and at least one validation station (ST), in that the portable article includes a game memory (MJ) containing an authenticatable set of game data (JE) representing a game, a result memory (MR) able to contain an encrypted result information item (IFRc), a first communication interface (ESC) able to [cooperate with a housing-communication interface (ESB), and a second communication interface (ESC) able to] communicate with a station-communication interface (ESS), in that the housing includes a key memory (MC) containing a result-encryption key, a write- and read-accessible working memory (MT), and a processing unit (UT) linked to these memories as well as to the housing-communication interface, the processing unit being capable, during cooperation between the housing-communication interface [and the first communication interface of the article, of verifying the authentication of the set of game data stored in the article and of storing the said set in the working memory so as to allow the running of the game in the housing, then of encrypting a result information item (IFR) dependent on the said game, with the aid of the result-encryption key, and of communicating this encrypted result information item (IFRc) to the housing-communication interface for the purposes of the storage thereof in the result memory of the article, and in that the validation station (ST) includes means (PR) able to determine the said result-encryption key and station-processing means (PR) able*

to read the encrypted result information item via the station-communication interface, during cooperation between the portable article and the station, and to perform a validation processing from at least this encrypted result information item and the result-encryption key.

18. *Device according to Claim 17, characterized in that the station-processing means include station-decryption means able to decrypt the encrypted result information item.*

19. *Device according to Claim 17, characterized in that the processing unit of the housing is able also to communicate the unencrypted result information item to the housing-communication interface for the purposes of storage thereof in the result memory of the article, and in that the station-processing means are furthermore able to read the unencrypted result information item via the station-communication interface, and include station-encryption means able to encrypt the said unencrypted result information item with the aid of the result-encryption key, as well as comparison means for comparing the recalculated encrypted result information item with the encrypted result information item stored in the result memory of the portable article.*

20. *Device according to one of Claims 17 to 19, characterized in that the first communication interface (SEC) of the portable article is a serial interface.*

21. *Device according to one of Claims 17 to 20, characterized in that the authenticatable set of game data is associated with an authentication certificate and in that the means of verifying the authentication of this set of game data include certificate calculation means able to recalculate the said authentication certificate from the set of game data, and comparison means able to compare the recalculated certificate and the certificate stored in the game memory of the portable article.*

22. *Device according to one of Claims 17 to 21, characterized in that it comprises encryption means able to encrypt at least partially the set of authenticatable game data (JE), or an information item (CTF) linked with this set of game data, from at least one game-encryption key, and in that the key memory of the housing is able to contain the said game-encryption key whilst the means of verifying the authentication of the set of game data include decryption means linked to the key memory.*

23. *Device according to Claims 21 and 22, characterized in that the encryption means encrypt only the authentication certificate (CTF).*

24. *Device according to Claim 22 or 23, characterized in that the encryption means (CPU) are incorporated with the portable article.*

25. *Device according to one of Claims 22 to 24, characterized in that the game-encryption key is stored encrypted and in that the processing unit (UT) of the housing includes means for decrypting this game-encryption key.*

26. *Device according to one of Claims 17 to 25, characterized in that it comprises means (CPU) for invalidating the authenticatable set of game data of a portable article.*

27. *Device according to one of Claims 17 to 26, characterized in that it comprises means (CPU) for prohibiting the writing of the encrypted result information item to the result memory of the portable article.*

28. *Device according to Claim 26 or 27, characterized in that the invalidation means (CPU) and/or the prohibiting means (CPU) are incorporated into the portable article.*

29. *Device according to one of Claims 17 to 28, characterized in that it comprises several housings, several portable articles and several validation stations, any one of the portable articles being capable of cooperating with any one of the housings and with any one of the validation stations."*

WO 96/34368 is a French language PCT application corresponding to Patent EP 0 824 732 B1. It contains an English language abstract, which Applicant provides as a concise statement of relevance of PCT application WO 96/34368:

> *"An electronic gaming device has one or more housing with at least one result-encryption key stored therein, as well as a portable article adapted for cooperating with the housing and with a set of authenticatable digital game data representative of a game stored therein. The portable article is made to co-operate with the housing. The set of game data is authenticated in the housing and stored in a working memory of the housing so as to authorize the progression of the game in the housing. After completion of at least part of the game, result information dependent on said game is encrypted in the housing by means of at least one result-encryption key, and the encrypted result information is stored in a result memory of the portable article, which then co-operated with a validation*

station capable of accessing the result-encryption key, whereafter said station verifies the result information."

CERTIFICATION AND/OR FEE

Because this Information Disclosure Statement is being submitted prior to issuance of the first action on the merits of the above-captioned application, no certification or fee is required.

If any charges are deemed appropriate, applicants hereby authorize the U.S. Patent Office to charge any fee to our Deposit Account No. 50-1824 under our reference number 16222.004

Respectfully submitted,

Jay Chawla
